MONTHLY WEATHER MAP

METEOROLOGICAL SERVICE, DOMINION OF CANADA

MAY 1937

TEMPERATURE

The month was warmer than a normal May over the greatest part of Canada and Newfoundland. The exceptions were a portion of British Columbia, the Lower Mackenzie valley, and the eastern portion of Hudson Strait.

In British Columbia temperatures averaged about normal on the outer coast of Vancouver Island, at the mouth of the Fraser, in the East Kootenay, and in the far northern interior. There was an excess of two degrees on the lower portion of the inner coast of Vancouver Island and in the inlets of the mainland opposite. Along the northern inlets there was a general deficiency of two degrees, although at Prince Rupert the mean temperature was normal. In the Okanagan and Similkameen valleys temperatures were about one degree below normal and in the western portion of the South Thompson valley two degrees below. On the interior plateau between the Rocky Mountains and the Fraser River there was probably a deficiency of two or three degrees. In the West Kootenay temperatures were about one degree above normal.

Over the grain region of the prairie provinces temperatures averaged higher than normal. The excesses were two or three degrees in Alberta, three to six degrees in Saskatchewan, and the same in Manitoba.

In Ontario temperatures were two to four degrees in excess of normal from the Lake of the Woods to the northwest coast of Lake Superior and also along the Height of Land separating the Lake Huron and Ottawa drainage basins from the Abitibi River. In the region of Lake Nipigon and Manitoulin Island and locally in extreme southwestern Ontario there were areas where the temperature averaged normal or slightly below. Generally in the Lower Lake region temperatures were one or two degrees above normal.

In Quebec along the Middle St. Lawrence temperatures were generally three to five degrees above normal but four to six degrees in the region of the St. Maurice, the Saguenay, and the Height of Land. In the upper part of the Gatineau valley the excesses were about two degrees. Along the Lower St. Lawrence and the Gulf excesses were two or three degrees.

In New Brunswick along Northumberland Strait the excess over normal temperature was two degrees but on the Bay of Fundy and in the valley of the River St. John mostly three to five degrees. In Prince Edward Island and Nova Scotia the excess over normal temperature was generally three or four degrees but at Halifax was only two degrees, while temperatures on Sable Island were normal.

On the east coast of Newfoundland temperatures were two or three degrees above normal but in southwestern Newfoundland averaged about normal.

At the eastern entrance to Hudson Strait temperatures were two or three degrees below normal but at the western entrance slightly above normal. Along the western coast of Hudson Bay temperatures were six to nine degrees above normal.

PRECIPITATION

Precipitation was deficient by about thirty per cent. of the normal amount along the north shore of Juan de Fuca Strait but fifteen to sixty per cent. in excess along the Strait of Georgia and along the Pacific coast as far as Princess Royal Island. At Prince Rupert there was a slight deficiency. In the Upper Fraser valley there were excesses of fifty to one hundred and seventy per cent. but in the Similkameen, Nicola, Kettle, Kootenay, and Thompson valleys deficiencies were thirty-five to forty per cent. for the most part. Along Lake Okanagan deficiencies were small. Both excess and deficiency were reported locally from the headwaters of the Columbia River.

In Alberta there were deficiencies of twenty-five to fifty per cent. in the Peace River country. Elsewhere in Alberta precipitation was very irregularly distributed, both excess and deficiency occurring in all districts. Deficiencies were more numerous than excesses.

In Saskatchewan there were excesses of thirty to sixty per cent. in the region between the north and south branches of the Saskatchewan River but elsewhere deficiencies of twenty-five to seventy-five per cent. were of general occurrence.

In Manitoba the normal amount was reached or exceeded in most districts. In the extreme southwest there was a deficiency of about fifteen per cent. but elsewhere excesses of fifteen to fifty per cent. were generally reported.

Along the north coast of Lake Superior and thence westward to the Lake of the Woods twice to three times the normal amount was reported from most stations, although stations on the Lake of the Woods reported both excess and deficiency.

Eastward from Lake Superior through the Lower Lake region and along the Ottawa and St. Lawrence Rivers to Quebec City there was a rather general deficiency averaging about thirty-five per cent. Exceptions were the ridge between Lakes Huron and Ontario, the immediate neighborhood of the Niagara River and the vicinity of Lake Champlain where local excesses were reported.

At the mouth of the Saguenay there was an excess of twenty-five per cent. but precipitation was deficient at most stations around Lake St. John as well as at those reporting from the Upper St. Maurice and the Gatineau Rivers. Along the Lower St. Lawrence and Anticosti Island both excess and deficiency were reported locally, but on the north shore of the Gulf more than twice the normal amount was measured.

In New Brunswick with a few local exceptions in the extreme southwest excess was about thirty-five per cent; in Nova Scotia about thirty per cent., except on the outer coast from Liverpool to Halifax where the excess was about fifteen per cent. and on Cape Breton Island where there was a deficiency of about ten per cent.

In southern Newfoundland there was a deficiency of about fifty per cent. but in northern Newfoundland an excess of about seventy per cent.

A. J. CONNOR

SPECIAL REPORTS

NOTE—Column H is Highest Temperature; Column L is Lowest Temperature; Column Tm is the mean temperature of the month; Column P is Precipitation in inches; Column I denotes total of bright sunshine in hours during the month.
